Lichens are able to colonize places where there are extremes of humidity, temperature and light, and they often occur in places

# Read PDF Lichen Biology

where few other macroscopic living things can survive. Lichens absorb water from the atmosphere, but unlike plants they have no means of keeping water within the lichen during dry spells.

*Lichen Biology | The British Lichen Society*

A lichen is an association between one or two fungus species and an alga or cyanobacterium (blue-green alga) that results in a form distinct... Lichens were once classified as single organisms—until the advent of microscopy, when the association of fungi with algae or cyanobacteria became evident. Although

# Read PDF Lichen Biology

lichens had been assumed to consist of a single fungus species (usually an ascomycete) and a single photosynthetic partner, research suggests that many macrolichens also feature specific ...
